

Complete Analytic Vector Fields on Open Unit Ball in \mathbb{R}^n

▪ Nuri Mohammed bin Youssef*

• Abstract:

We shall give complete description of the analytic vector fields on an open unit Euclidean ball, $B = \{x: \langle x, x \rangle < 1\}$ in \mathbb{R}^n with Vanish on unit sphere $S = \{x: \langle x, x \rangle = 1\}$ in \mathbb{R}^n .

Keywords : Vector fields, Complete vector field, Analytic mapping, Analytic function, Cayley trans formation.

■ ملخص:

سوف نقدم في هذه الورقة البحثية وصف كامل لتركيبية المتجهات الحقلية على كرة الوحدة المفتوحة $B = \{x: \langle x, x \rangle < 1\}$

في \mathbb{R}^n ، والتي تنتهي على ∂B

حيث $\partial B = \{x: \langle x, x \rangle = 1\}$ في \mathbb{R}^n حيث $\partial B \subset \mathbb{R}^n$.

Introduction

In our paper [1] we gave the complete structure of complete polynomial vector fields on open unit ball $B = \{x: \langle x, x \rangle < 1\}$ in \mathbb{R}^n ,

where $x = (x_1, x_2, \dots, x_n)$ our result was the form :

$$P(x) = R(x) - \langle R(x), x \rangle x + (1 - \langle x, x \rangle) Q(x)$$

for some polynomial mappings $R, Q: \mathbb{R}^n \rightarrow \mathbb{R}^n$, In [2] we proved that if

$F: \mathbb{R}^n \rightarrow \mathbb{R}^n$ is a polynomial and $P: \mathbb{R}^n \rightarrow \mathbb{R}^n$, be any polynomial such that $P(M) = 0$ and $M \subset \mathbb{R}^n$ then there is a polynomial

$q: \mathbb{R}^n \rightarrow \mathbb{R}^n$, such that $P = q \cdot F$ when $F(x) = Q_1(x) \cdot Q_2(x) \cdot \dots \cdot Q_n(x)$,

*Associate Professor, Department of Mathematics - Faculty of Sciences - University of Tripoli

and Q_i are linearly independent affine functions.

In [1] we proved that if $F: \mathbb{R}^n \rightarrow \mathbb{R}$, be a polynomial such that $f(x) = 0$ for $X \in S$ where $S = \{x: \langle x, x \rangle = 1\}$. Then there exists a polynomial $Q: \mathbb{R}^n \rightarrow \mathbb{R}$, such that $f(x) = (1 - \langle x, x \rangle) Q(x)$.

Our main Result.

Definition : Given any subset K in \mathbb{R}^n , the set of n tuples and mapping $V: \mathbb{R}^n \rightarrow \mathbb{R}^n$, we say that V is complete victor field in K . If for every point $k_0 \in K$. There exists a curve $X: \mathbb{R} \rightarrow K$ such that $X(0) = k_0$,

and $\frac{dx(t)}{dt} = V(x(t))$ for all $t \in \mathbb{R}$.

CAYLEY TRANSFORM - [2]

Inversion:

$I: \mathbb{R}^n \setminus \{-e\} \leftrightarrow \mathbb{R}^n \setminus \{e\}$.

$I(x) = -e + 4 \frac{x+e}{\|x+e\|^2}$

Well-known : $I = I^{-1}$

$I: S \setminus \{-e\} \leftrightarrow E$, where S is unit sphere and $E := \{x : x - e \perp e\}$

Cayley transform:

$C(x) = I(x) - e = -2e + 4 \frac{x+e}{\|x+e\|^2}$

$C: S \setminus \{-e\} \leftrightarrow E_0 = E - e_0 = \{x : x \perp e\}$

$B = \{x : \|x\| < 1\} \leftrightarrow H_0 = \{x: \langle x, e \rangle > 0\}$

Theorem 1: Assume that $G \subset \mathbb{R}^n$ is an open connected set such that $G \cap E_0 \neq \emptyset$. And let $\phi: G \leftrightarrow \mathbb{R}$ be an analytic function such that $\phi(x) = 0$ for all $x \in G \cap E_0$. Then $\phi(x) = x_1 \Psi(x)$ for some analytic function $\Psi: G \leftrightarrow \mathbb{R}$ where $x_1 = \langle x, e \rangle$ and $x = (x_1, x_2, \dots, x_n) \in \mathbb{R}^n$.

Proof: Let $E_0 = \{ p \in \mathbb{R}^N : x_1(p) = 0 \}$, be a hyper-plane $\phi(p) = 0$ for $p \in E_0$.

$$\phi(p) = \sum_{k=1}^{\infty} \sum_{n_1+\dots+n_N=k} a_{n_1\dots n_N} x_1^{n_1}(p) \dots x_N^{n_N}(p)$$

$$p \in E_0 \implies x_1(p) = 0, x_1^{n_1}(p) \dots x_N^{n_N}(p) = 0, \text{ if } n_1 > 0$$

E_0

$$0 = \phi(p) = \sum_{k=1}^{\infty} \sum_{n_2+\dots+n_N=k} a_{n_0 n_2 \dots n_N} x_2^{n_2}(p) \dots x_N^{n_N}(p), \text{ by assumption.}$$

$$p = \xi_2 e_2 + \dots + \xi_N e_N \in E_0, \xi_2, \dots, \xi_N \in \mathbb{R}, \text{ arbitrary.}$$

$$0 = \phi(p) = \sum_{n_2+\dots+n_N=k} a_{n_0 n_2 \dots n_N} \xi_2^{n_2} \dots \xi_N^{n_N}$$

$$a_{n_0 n_2 \dots n_N} = \frac{\partial^{n_2+\dots+n_N} \phi(\xi_2 e_2 + \dots + \xi_N e_N)}{\partial x_2^{n_2} \dots \partial x_N^{n_N}} \frac{1}{n_2! \dots n_N!} = 0.$$

$$a_{n_0 n_2 \dots n_N} = 0, \forall n_2, \dots, n_N.$$

$$\phi(p) = \sum_{k=1}^{\infty} \sum_{\substack{n_1+\dots+n_N=k \\ n_1 > 0}} a_{n_1 n_2 \dots n_N} x_1^{n_1}(p) \dots x_N^{n_N}(p)$$

$$= x_1(p) \sum_{k=1}^{\infty} \sum_{\substack{n_1+\dots+n_N=k \\ n_1 > 0}} a_{n_1 n_2 \dots n_N} x_1^{n_1-1}(p) \dots x_N^{n_N}(p)$$

$$= x_1(p) \psi(p).$$

$$\psi(p) = \sum_{l=0}^{\infty} \sum_{m=0}^{\infty} \sum_{n_2+\dots+n_N=l} a_{n_1 n_2 \dots n_N} x_1^m(p) \dots x_N^{n_N}(p)$$

With $m=n_1-1$ and $l=k-1$. ■

Theorem 2 : Assume $u \subset \mathbb{R}^N$ is an open connected set such that $-e \notin u$ and $S \cap u \neq \emptyset$ and let $f: u \rightarrow \mathbb{R}$ be an analytic function such that $f(x) = 0$ for all $x \in S \cap u$.

Then $f(x) = (\|x\|^2 - 1) g(x)$ for some analytic function $g: u \rightarrow \mathbb{R}$.

Proof: Define $G := C(u)$ and $\phi := f \circ C^{-1}$ is terms of the Cayley transform C . Then $\phi(x) = 0$ for all $x \in C(u \cap S) = C(u \cap [S \setminus \langle 0 \rangle]) = C(u) \cap C(S \setminus \langle 0 \rangle) = G \cap E_0 \neq \emptyset$.

Then by the Theorem 1 , we can write $\phi(x)=x_1 \psi(x)$ with an analytic function $\psi:G \rightarrow R$. Since $f = \phi \circ C$, we have ,

$$f(x) = [C(x)]_1 \psi(C(x)) \quad (x \in u).$$

Let us calculate $[C(x)]_1$:

$$\begin{aligned} [C(x)]_1 &= \langle C(x), e \rangle = \langle -2e + 4 \frac{x+e}{\|x+e\|^2} \mid e \rangle \\ &= -2 + 4 \frac{x_1+1}{\|x+e\|^2} = -2 + \frac{4x_1+4}{\|x\|^2 + 2\langle x \mid e \rangle + \|e\|^2} \\ &= -2 + \frac{4x_1+4}{\|x\|^2 + 2x_1 + 1} = \frac{1}{\|x\|^2 + 2x_1 + 1} \left[-2\|x\|^2 - 4x_1 - 2 + 4x_1 + 4 \right] \\ &= \frac{2-2\|x\|^2}{\|x+e\|^2}. \end{aligned}$$

Therefore the function

$$g(x) := -2 \frac{\psi(C(x))}{\|x+e\|^2} \quad (x \in u).$$

Satisfy our requirements. ■
